This listing of claims will replace all prior versions, and listings, of claims in the application:

Claims 1 - 9 (Cancelled).

10. (Currently Amended) A field device for monitoring and/or determining a process variable of a medium, wherein the process variable is preferably a fill level, viscosity or density of the medium, comprising:

an oscillatable unit [[,]];

a driving/receiving unit, which excites said oscillatable unit to oscillate, or which receives oscillations of said oscillatable unit [[,]] as the case may be; and a control/evaluation unit, which controls the oscillations of said oscillatable unit, or which evaluates the oscillations of said oscillatable unit [[,]] as the case may be, wherein:

said control/evaluation unit produces an accretion alarm, when the oscillation frequency of the oscillations of said oscillatable unit falls below an adjustable limit value;

said adjustable limit value is determined and/or calculated from the smallest oscillation frequency as a function of the <u>corresponding</u> maximum (with reference to the field device[[,]])allowable process conditions and/<u>or</u> as a function of the maximum[[,]] (with reference to the field device and with reference to the application) allowable process variable to be monitored and/or determined; [[and]]

said process conditions involve temperature and/or pressure and/or density and/or viscosity and/or fill level of the medium[[.]];

the process variable is fill level;

said adjustable limit value is determined and/or calculated as a function of the use of the field device, whether as a minimum switch or as a maximum switch;

said control/evaluation unit produces a report, when the oscillation frequency of the oscillations of said oscillatable unit exceed an adjustable over-value;

said adjustable over-value is determined and/or calculated from measured and/or calculated dependencies of the oscillation frequency on the process variable to be determined and/or to be monitored; and

said adjustable over-value is determined and/or calculated from a greatest oscillation frequency as a function of corresponding maximum, in reference to the field device, allowable process conditions and as a function of said oscillatable unit oscillating uncovered.

- 11. (Cancelled)
- 12. (Cancelled).
- 13. (Previously presented) The field device as claimed in claim 10, wherein:

said adjustable limit value is determined and/or calculated taking into consideration a frequency change associated with a maximum allowable accretion.

- 14. (Cancelled).
- 15. (Previously presented) The field device as claimed in claim 10, further comprising:

a review unit which produces an accretion alarm independently of said control/evaluation unit, when the oscillation frequency of said oscillations of said oscillatable unit falls below an adjustable limit value.

- 16. (Cancelled)
- 17. (Cancelled)
- 18. (Currently Amended) The field device as claimed in claim [[16]] <u>10</u>, wherein:

said adjustable over-value is determined and/or calculated taking into consideration a maximum allowable accretion, or a frequency change associated with the maximum allowable accretion.
